Summary	This protein belongs to the aldehyde dehydrogenase family of proteins. Aldehyde dehydrogenase is the second enzyme of the major oxidative pathway of alcohol metabolism. Two major liver isoforms of aldehyde dehydrogenase, cytosolic and mitochondrial, can be distinguished by their electrophoretic mobilities, kinetic properties, and subcellular localizations. Most Caucasians have two major isozymes, while approximately 50% of Orientals have the cytosolic isozyme but not the mitochondrial isozyme. A remarkably higher frequency of acute alcohol intoxication among Orientals than among Caucasians could be related to the absence of a catalytically active form of the mitochondrial isozyme. The increased exposure to acetaldehyde in individuals with the catalytically inactive form may also confer greater susceptibility to many types of cancer. This gene encodes a mitochondrial isoform, which has a

Gene prediction

▶ Evidence-driven gene prediction

- ▶ Definition: A gene finding system that the target genome is searched for sequences that are similar to extrinsic evidence in the form of the known sequence of a mRNA or protein product.
- ▶ 1) Transcript mapping based on EST, RNA-seq data
- ▶ 2) Homology search
 - ▶ Align cDNAs (or proteins) from homologous genes of other species. A useful approach to annotating genes for which there is little or no cDNA.

Gene prediction

- ▶ *Ab initio* gene prediction

- ▶ Definition: An approach to gene prediction in which the only inputs are genome sequences.
- ▶ Find ORFs
 - ▶ Search start ATG codon and stop codons.
 - ▶ Easy for prokaryotes.
 - ▶ Inefficient for eukaryotes due to intron-exon structure.
 - ▶ Intron-exon structure can be taken into consideration.

Gene prediction

- ▶ Combined approaches

- ▶ *ab initio* prediction + evidence-based prediction
- ▶ Modern gene predictors implement this approach.

- ▶ A general workflow

- ▶ 1) Collect reliable evidence
 - Accurate cDNA sequences, well-annotated homologous sequences
- ▶ 2) Training by the evidences
- ▶ 3) Gene prediction based on trained data

- ▶ Merge multiple predictions:

- ▶ Different prediction software produce different gene sets and different structures. “Choosers and combiners” software choose and merge gene models.

Gene prediction in practice

▶ Bacteria

- ▶ Algorithm and software are well developed. Accurate prediction expected.
- ▶ ab initio approach works very well
- ▶ Software examples: Glimmer, GeneMark, Prodigal

▶ Eukaryote

- ▶ Still difficult.
- ▶ Hybrid approach (ab initio + evidence) is common
- ▶ Software examples: Augustus, BRAKER

Repetitive Annotation

- ▶ Many genomes contain a large fraction of repetitive sequences - e.g., ~50% of the human genome is derived from repeats
- ▶ Once regarded as “junk DNA,” repeats are now known to hold functional and/or evolutionary relevance
- ▶ => Accurate identification and annotation of repeats is a key step in genome analysis
- ▶ Repeats can interfere with downstream analyses (e.g., gene prediction, structural annotation)
- ▶ => Repeat regions are often masked prior to downstream steps

Types of repeats

- ▶ 1. Transposon-derived repetitive elements
- ▶ 2. Simple sequence repeats
- ▶ 3. Segmental duplications.
- ▶ 4. Non-interspersed repeats

Repetitive elements: Transposons

- LINEs (Long Interspersed Elements) and SINEs (Short Interspersed Elements) are 2 classes of Non LTR Transposons.
- Non-LTR Retrotransposons transpose through an RNA intermediate utilizing a reverse transcriptase and lack flanking terminal repeat sequence (LTRs).
- LINEs are ~ 6 Kb long, Observed in protozoans, insects, and plants. Abundant in mammalian genomes
- SINEs are ~ 300 bp long and are found primarily in mammalian DNA

Repetitive elements: Transposons

- LTR retrotransposons are generally 5–7 kb long. They are characterized by having long terminal direct repeats (LTR) a few hundred base pairs long between which there are open reading frames equivalent to the ***gag*** and ***pol*** genes of a retrovirus.
- DNA transposons generally move by a cut-and-paste mechanism in which the transposon is excised from one location and reintegrated elsewhere. DNA transposons consist of a transposase gene that is flanked by two Inverted Repeats (IVRs)

Types of repeats

- ▶ 1. Transposon-derived repetitive elements
- ▶ 2. Simple sequence repeats
 - ▶ Microsatellite
 - ▶ Short tandem repeats, STR
 - ▶ Telomere (human:TTAGGG)
- ▶ 3. Segmental duplications.
- ▶ 4. Non-interspersed repeats
 - ▶ Ribosomal DNA etc.

Annotation of repetitive elements

RepeatModeler & RepeatMasker

- ▶ リピート解析の標準ワークフロー
- ▶ Website: <https://github.com/Dfam-consortium/RepeatModeler>
<https://www.repeatmasker.org/>
- ▶ RepeatModeler: de novo リピート検出
 - ▶ 役割: 既知のデータベースに頼らず、そのゲノムに特有のリピートを「新しく見つける」
 - ▶ 仕組み: RepeatScout (k-mer解析) や RECON (クラスタリング) 等を統合
 - ▶ 入力: ゲノム配列
 - ▶ 出力: 種特異的な「リピートコンセンサス配列ライブラリ」(-families.fa)
- ▶ RepeatMasker: 既知リピートの探索とマスキング
 - ▶ 役割: ライブラリや既存DB (Dfam等)と照合し、ゲノム上のリピート位置を特定
 - ▶ 入力: ゲノム配列、リピートライブラリ(Public/Custom)
 - ▶ マスキングの種類:
 - ▶ ソフトマスク(Soft Masking) : 該当領域を「小文字」にする(遺伝子予測で推奨)
 - ▶ ハードマスク(Hard Masking) : 該当領域を「N」で置換する

RepeatModeler

- ▶ Input: genome (FASTA)

- ▶ データベース作成

```
$ BuildDatabase -name NAME genome.fasta
```

- ▶ リピート検索実行

```
$ RepeatModeler -database NAME threads 12 -LTRStruct
```

- ▶ Output

- ▶ [NAME]-families.fa → 検出されたリピートファミリーごとのコンセンサス配列 (RepeatMaskerに使える)

RepeatMasker

▶ Input:

- ▶ genome (FASTA)
- ▶ データベース(custom/public)

```
$ RepeatMasker \  
  -xsmall \  
  -lib [NAME]-families.fa \  
  genome.fasta
```

▶ Output

- ▶ *.fasta.masked → ソフトマスク済みゲノム配列(以降の遺伝子予測に利用)
- ▶ *.fasta.out → RepeatMasker の詳細結果(テキスト)
- ▶ *.out.gff → リピート注釈のGFF出力
- ▶ *.fasta.tbl → リピートの分類別サマリー(論文でも頻用される形式)

アノテーションのリフトオーバー（転用）

- ▶ 既存の高品質アノテーションの継承と転写
- ▶ リフトオーバー(Liftover)とは
 - ▶ 同種の別系統や、更新された新アセンブリに対し、既存の高品質な遺伝子モデルを「転写(移植)」する操作
 - ▶ 真核生物の新規遺伝子予測(de novo) は計算コストが高いため、信頼できるリファレンスがある場合に極めて有効
- ▶ 主な活用シーン
 - ▶ 同種の別系統への転用：標準株(リファレンス)の情報を、解析対象の系統に移植
 - ▶ アセンブリのバージョンアップ：ゲノム配列を更新した際、旧バージョンのアノテーションを引き継ぐ
- ▶ Tool: liftoff

Liftoff の使い方

▶ Website: <https://github.com/agshumate/Liftoff>

▶ Inputs:

▶ ターゲットゲノム: FASTA

▶ リファレンスゲノム: FASATA

▶ リファレンスアノテーション: GFF

▶ Usage

```
$ liftoff \  
-p 4 \  
-o CanAlb.liftover.gff3 \  
-dir liftoff_out \  
-g genomic.gff \ # reference annotation  
-copies \  
-sc 0.97 \  
-flank 0.2 \  
-d 4.0 \  
-polish \  
-u unmapped_features.txt \  
target_genome.fasta \  
reference_genome.fna \  

```

構造アノテーションの評価

- ▶ Coding gene 遺伝子予測: BUSCO
 - ▶ Protein mode or transcript mode
- ▶ RNA-seqとの比較
 - ▶ IGVによる可視化
 - ▶ gffcompare による比較
